Generation of Laguerre-gaussian modes

WG3 9 June 2009

John Nelson

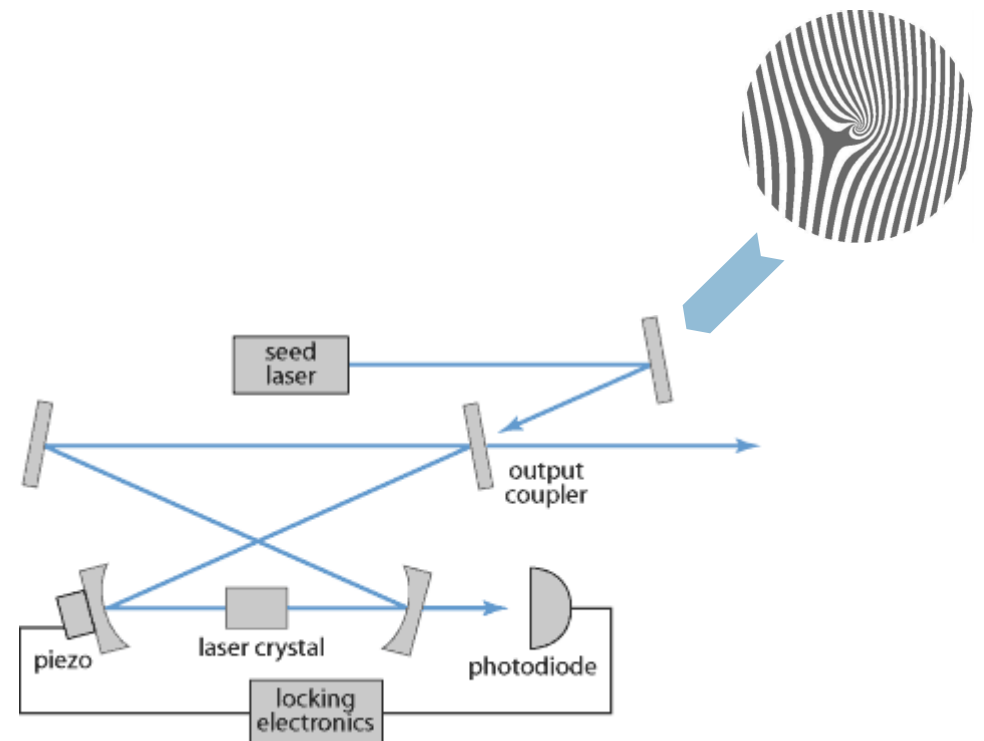

Spatial light modulation

- No point in doing this after we have a high power gaussian beam ($>100\text{W}$) – we'd be losing more than half of the power
- Also, the mode converting optic would have to be able to stand the power – a Spatial Light Modulator certainly wouldn't

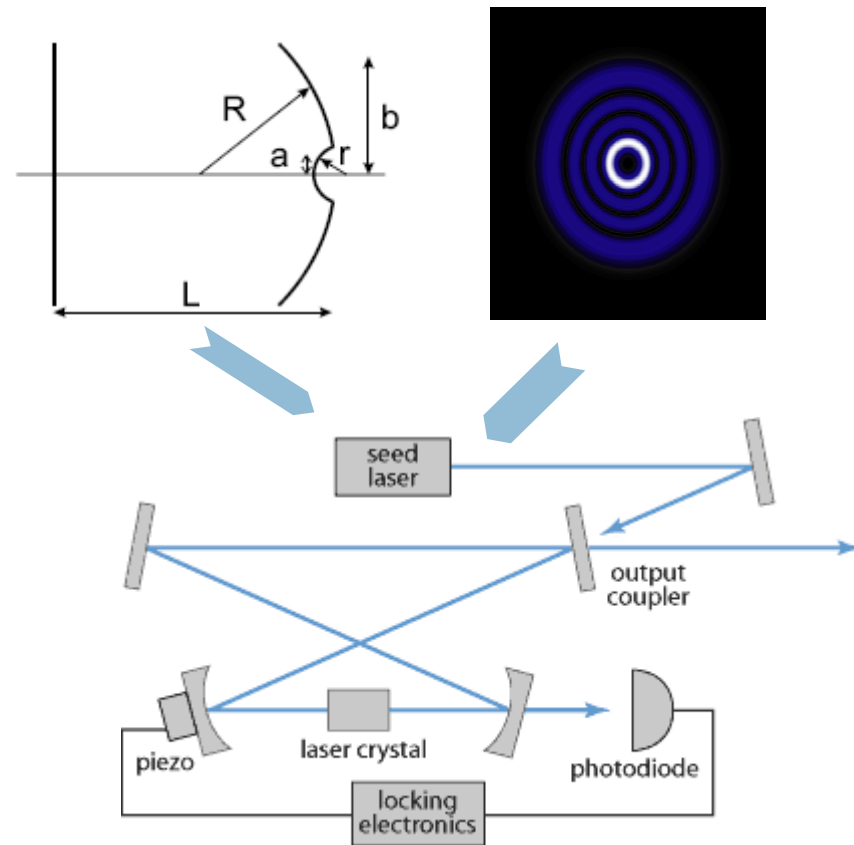

Master/slave laser

- Take the gaussian output of the master laser and convert to the desired Laguerre-gaussian mode
- Inject this into the slave laser and lock to this mode
- Grating structure can be patterned onto a fused silica substrate

Bifocal/axicon cavities

- Don't convert the output of the master laser
- Arrange the laser cavity so that the output is the mode you want

HG output

- Conventional laser cavity can be aligned to give HG mode output
- Can use an astigmatic mode converter (two cylindrical lenses) to convert to LG mode

Summary

- In principle, there is no reason why we can't generate a high power Laguerre-gaussian mode of any order we want
- Need to look in detail at which method will give the best performance

Thank you!
